# Outline

- About AmLight Express and Protect (AmLight-Exp)
- Major Facilities Supported by AmLight-Exp
- SLA-Driven science use case: Vera Rubin Observatory

# About AmLight Express and Protect (AmLight-Exp)

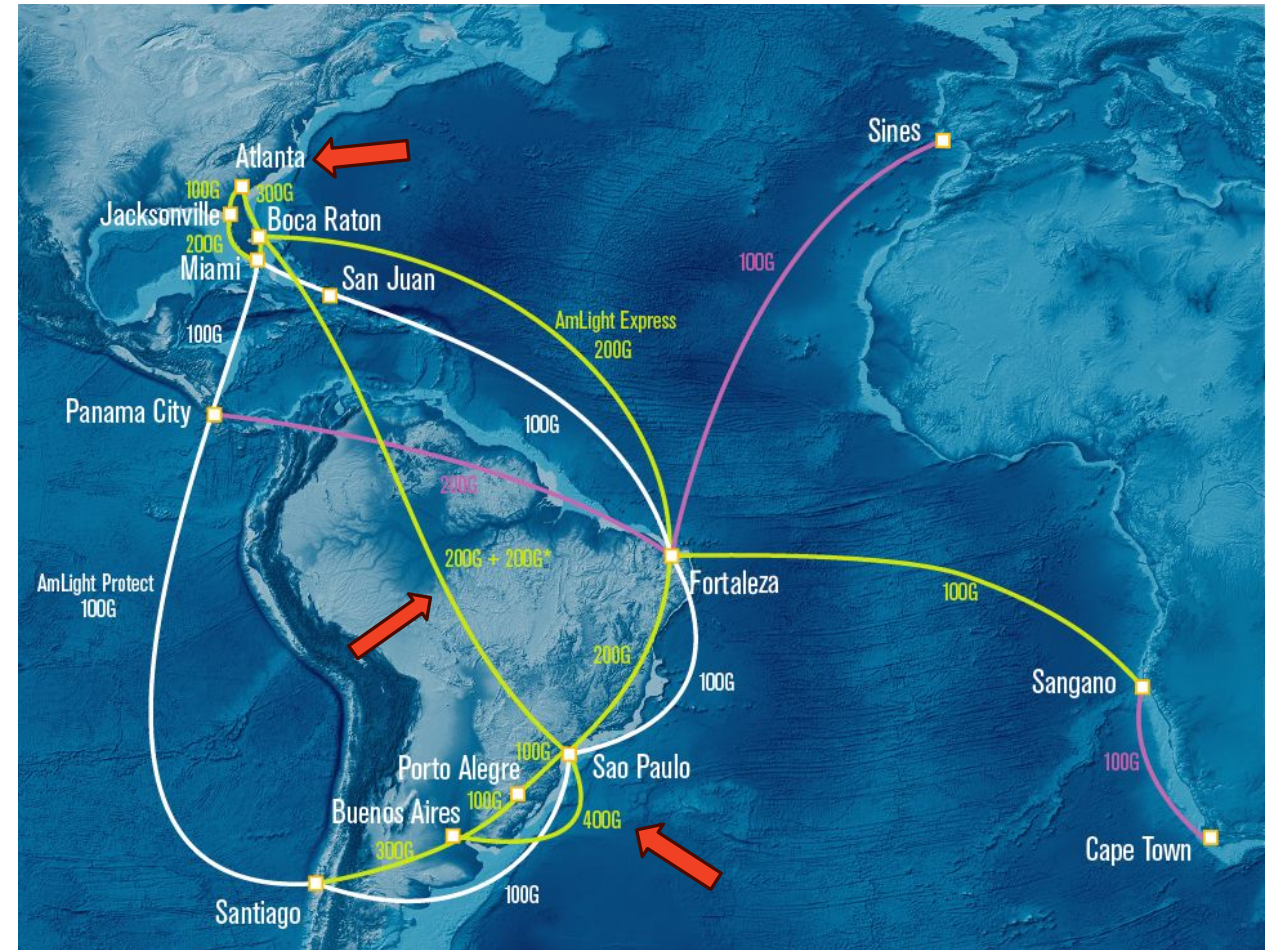

# AmLight Express and Protect Project

- AmLight-Exp is an international R&E network built to enable collaboration among Latin America, Africa, the Caribbean and the U.S.
- Supported by NSF and the IRNC program under award #OAC-2029283
- Partnerships with R&E networks in the U.S., Latin America, Caribbean and Africa, built upon layers of trust and openness by sharing:
  - Infrastructure resources
  - Human resources

# AmLight-Exp Network Infrastructure

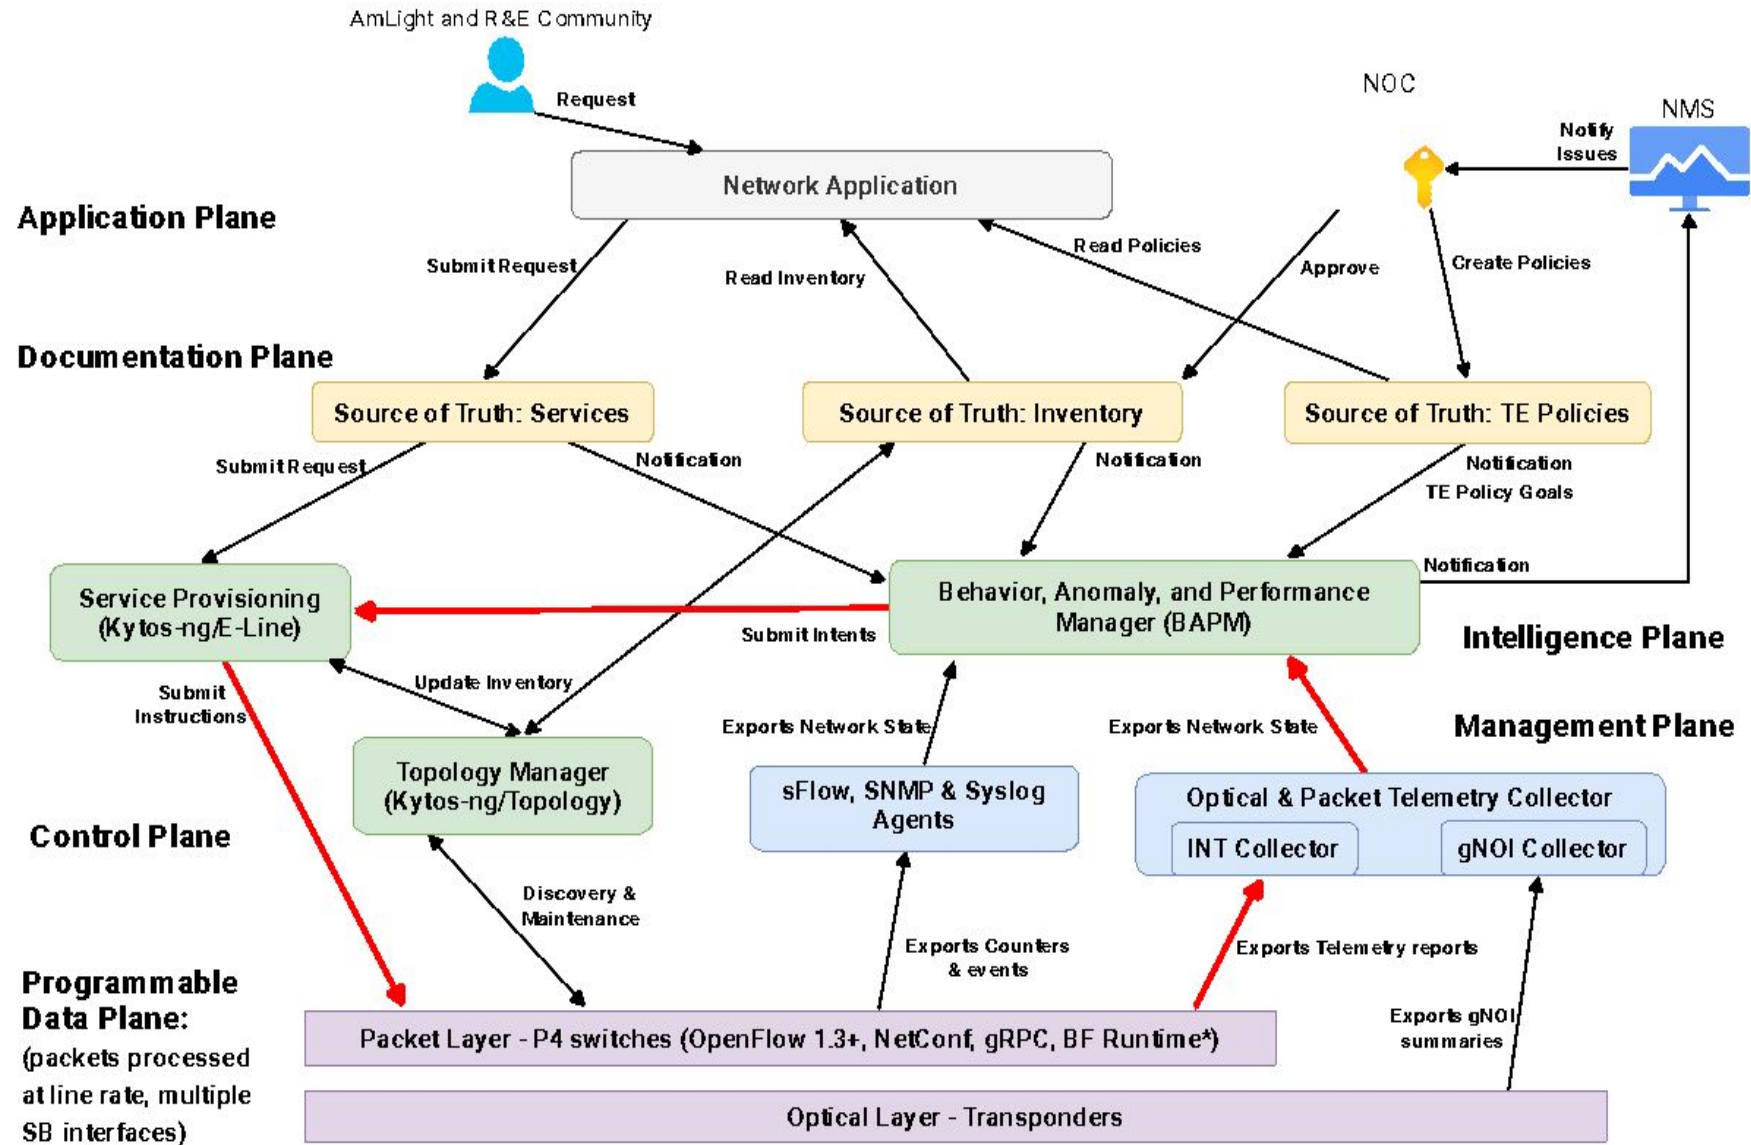

- 600G of upstream capacity between the U.S., Latin America, Caribbean and 100G to Africa
  - +400Gbps in 2024 and +200Gbps in 2024
- OXPs: Florida(3), Brazil(2), Chile, Puerto Rico, Panama, and South Africa
  - New: Georgia (Atlanta), Argentina (Buenos Aires)
- Production SDN Infrastructure since 2014
- Deeply programmable across the network stack
  - Programmable P4 Data Plane
  - Open Source SDN Controller
  - Fine-grained telemetry
  - Run-time network verification
  - Closed-Loop Orchestration
- Highly instrumented
  - PerfSonar, sFlow, Juniper Telemetry Interface (JTI), In-band Network Telemetry (INT)

# AmLight's Deeply Programmable Network Stack

## ■ Closed-Loop Orchestration:

- Fine-grained telemetry reports from the Data Plane
- Network State from the Management Plane
- Notifications result from the interpretation of network state by the Intelligence Plane
- Notifications and TE policy goals trigger intents to the Control Plane
- Instructions are submitted to the Data Plane to reprogram the forwarding path
- Network Verification and Packet Provenance
- Reduces the need for operator intervention

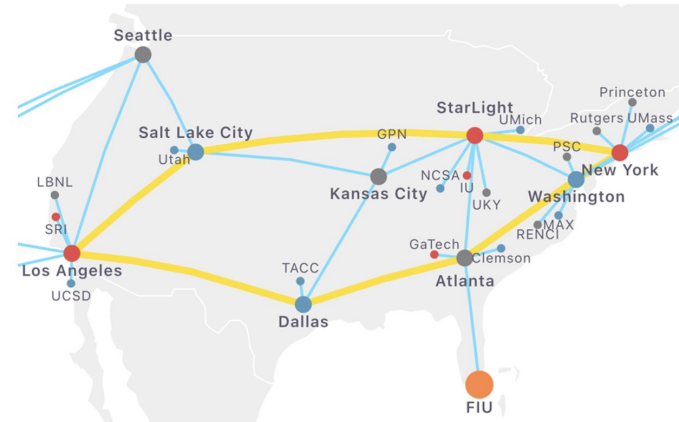

Major facilities supported by  
AmLight-Exp

# Major Facilities

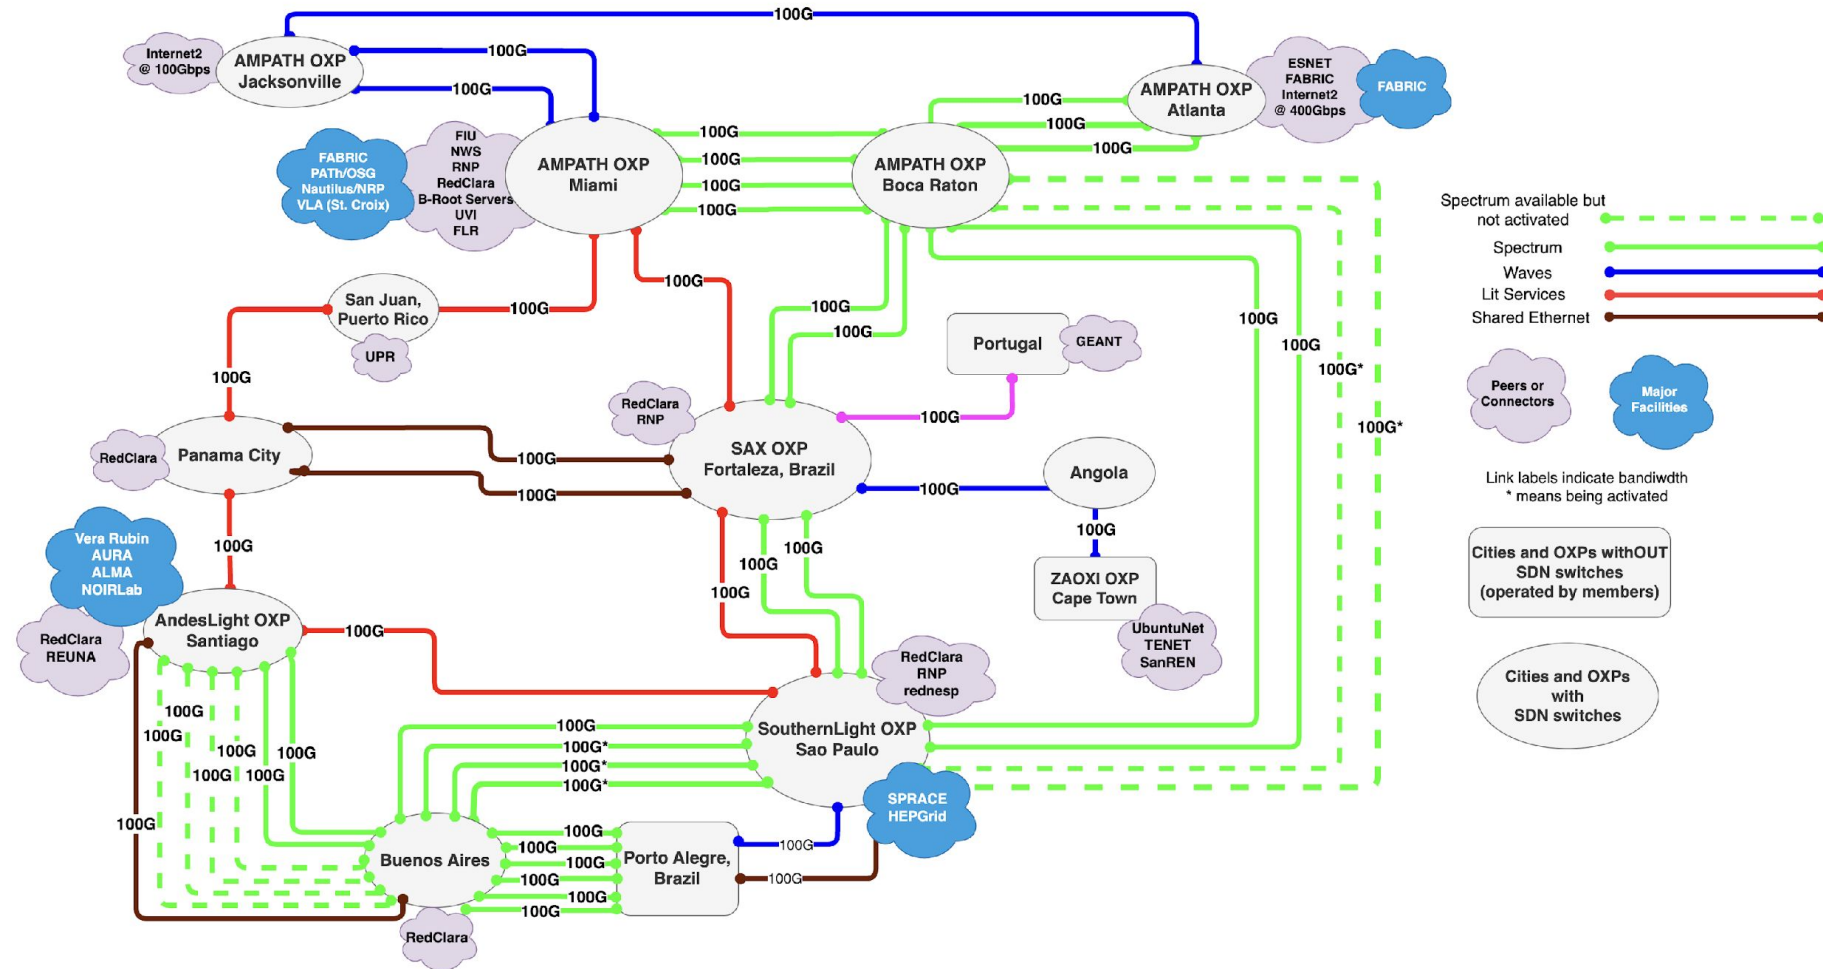

- NOIRLab
- ALMA
- Vera Rubin
- VLA (USVI)
- FABRIC
- Wall of Wind
- Open Science Grid and PATH

# Major Facilities supported by AmLight

- Major facilities are supported in Chile, Brazil, USVI, Florida, Georgia
- Multiple network diverse paths and bandwidth capacity are provisioned to provide high availability
- Open Exchange Points provide the flexibility to place computation and storage closer to major facilities

SLA-driven science use case:  
Vera Rubin Observatory

# Vera Rubin Observatory operation use case

- Vera Rubin is a large-aperture, wide-field, ground-based optical telescope under construction in northern Chile
- The telescope will take a picture of the southern sky every 27 seconds, and **produce a 13 Gigabyte data set**
- Each data set must be transferred to the U.S. Data Facility at SLAC, in Menlo Park, CA, **within 5 seconds, inside the 27 second transfer window**
- Challenges
  - High propagation delay in the end-to-end path
  - RTT from the Base Station to the USDF is approximately 180+ ms
  - 0.001% of packet loss will compromise the Rubin Observatory application
- Under Closed-Loop Control, AmLight's SDN infrastructure will continuously monitor the network substrate and reprogram the forwarding path in response to SLA requirements

# AmLight supports SLA-driven science applications

- AmLight has many links and multiple paths between its sites:
  - From Chile to Atlanta, there are more than 28 possible paths to take
  - With its deep programmable SDN architecture, AmLight effectively load balances network services across network paths, while respecting user constraints and requirements
- AmLight supports SLA-driven packet-loss-intolerant and sub-second-response-time-expected science applications:
  - With per-packet telemetry and sub-second network profiling capacities, AmLight can react to network conditions under 1 second
  - With optical telemetry, AmLight can anticipate issues with its substrate and steer traffic out of the substrate before adverse events happen
- AmLight network engineers are focused on building networks that run autonomously:
  - With the closed loop control, some time-consuming operational activities will be performed without human intervention
  - With deep programmability, AmLight network engineers can verify that the network is responding to SLA requirements

THANK YOU
