

Just FTP It?

Chris Bontempi, University of Connecticut Health Center
Network for Advanced NMR (NAN) - NSF Mid-scale RI-2
#1946970
CI Compass Virtual Workshop January 2025

Trail Map

- Brief project overview
- Data lifecycle from acquisition to dissemination
- Data acquisition to first storage architecture
- Issues addressed along the way and lessons learned
- Current and future challenges

Project Overview

- Nuclear Magnetic Resonance (NMR) - Spectrometers
- Network for Advanced NMR (NAN)
 - NSF Mid-scale RI-2 Consortium: Network for Advanced NMR Award #1946970
 - Joint project between UCHC, UGA and UW-Madison
 - 19 spectrometers at 3 facilities, including first publicly available 1.1GHz class spectrometers in the U.S.
 - Infrastructure/operation evaluated in 6-month workshop engagement with TrustedCI
- Objectives – Democratize the use of NMR
 - Archive NMR data
 - Good data stewardship
 - FAIR principles
 - Promote NMR facilities and services
 - Provide knowledge bases for various levels of expertise
 - Management tools and a conduit to publishing results
 - Accommodate various fields of use
 - Biology and Biophysics
 - Chemistry
 - Material Science
 - Metabolomics
- Pls
 - Jeff Hoch – University of Connecticut Health Center
 - Chad Rienstra – University of Wisconsin, Madison (NMRFAM)
 - Kathrine Henzler-Wildman – University of Wisconsin, Madison (NMRFAM)
 - Art Edison – University of Georgia, Athens (CCRC)

The NMRhub family...

Acquire
data with NAN

Process
data with NMRbox

Share
data with BMRB

Participate
in challenges with NUScon

...provides seamless integrations between powerful NMR platforms

Early Considerations for NAN Data Ingest

- NAN is a supplement to facility data storage and backups, not a replacement for it
- We're more likely to get more data if NAN requires minimal extra user steps – the stretch goal is no extra steps
- Should we keep it simple and just have the user FTP their data to the repository?
 - No – automation provides
 - Fewer user steps
 - Consistency of content

Data Lifecycle

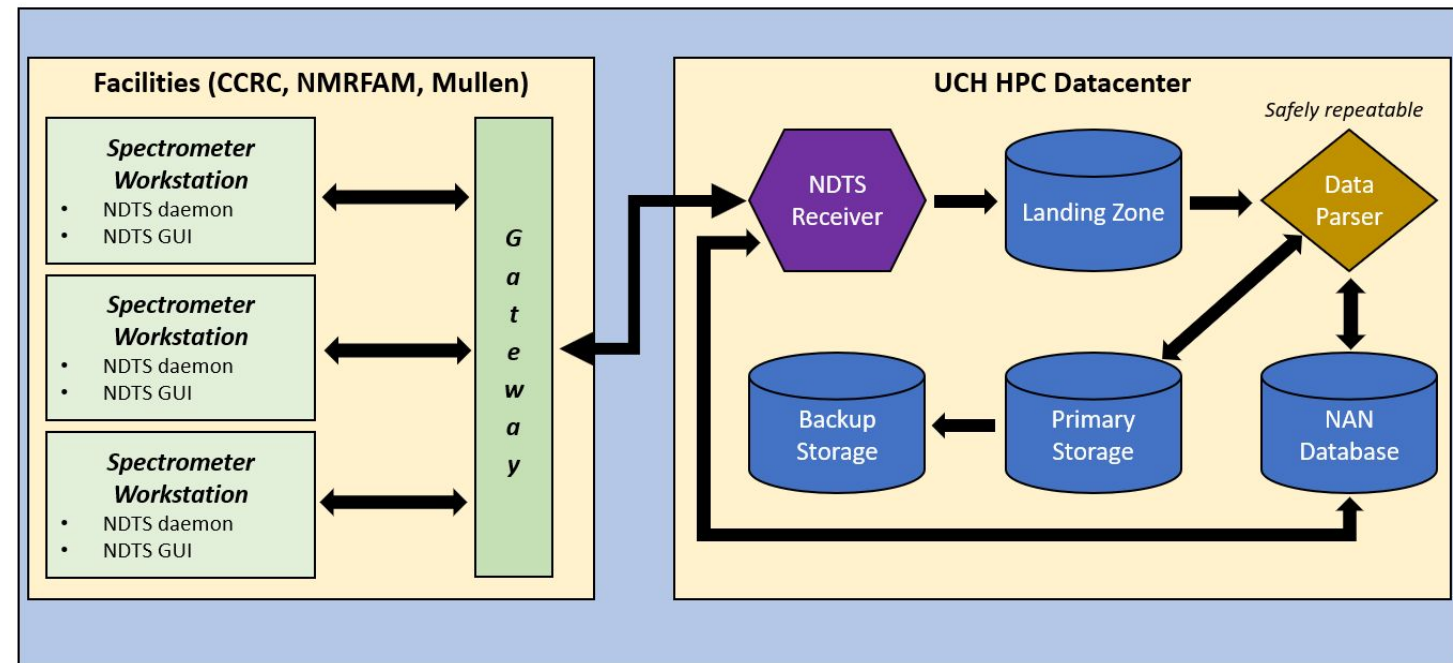

- Pre-configuration settings
 - Specified by the facility manager
 - Specified by the user
- Data acquisition modes
 - Results of acquisitions harvested live from active spectrometer workstations in near real time
 - Historical results manually uploaded from active spectrometer workstations at any time
 - Coming soon – archives of results manually uploaded from arbitrary locations
- Received and staged in landing zone
- Parsed into NAN repository
 - Identifier assigned
 - Contents interpreted
- Experimenter and PI of Experimenter can manage, modify, publish, share, and remove experiment data
- Original data is always preserved and archived on WORM devices
- 300K+ experiments harvested to date

The screenshot displays a web application interface for managing datasets. On the left, there is a sidebar with navigation options: Home, Data Connector, Datasets, Knowledgebases, My Collections, and my-first-project. The main area is titled 'All Datasets' and contains a table with columns: Dataset Name, Unique ID, Date, Non-Redundant, Instrument, and a final column with a dropdown arrow. The table lists 25 datasets, including exp801, exp7, cyroshimTest/4, ubiquitin/15, and exp40. Some datasets have counts in parentheses next to their names. At the bottom, a status bar indicates 'Showing datasets 1 through 25 of 25+ datasets.' and a pagination control shows '1'.

Dataset Name	Unique ID	Date	Non-Redundant	Instrument	
exp801	(2)	4/5/2024 1:07 PM	Yes	NMR400	s2pul
exp801		4/5/2024 11:23 AM	No	NMR400	s2pul
1D_acquisition_data/3		4/4/2024 2:15 PM	Yes	NMR500	topshim1d
exp7	(2)	4/3/2024 10:47 AM	Yes	NMR400	s2pul
exp7		4/3/2024 10:47 AM	No	NMR400	s2pul
cyroshimTest/4		4/1/2024 12:24 PM	Yes	NMR500	zg
exp1		3/24/2023 1:50 PM	Yes	NMR400	s2pul
ubiquitin/15	(2)	11/21/2022 3:48 PM	Yes	NMR600	zgpgwg
ubiquitin/15		11/21/2022 3:42 PM	No	NMR600	zgpgwg
exp40		7/4/2022 8:51 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:51 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:51 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:10 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:10 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:10 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:10 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:07 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:07 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 8:07 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 4:45 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 4:45 AM	Yes	NMR500	ghn_cacb
exp40	(5)	7/4/2022 4:45 AM	Yes	NMR500	ghn_cacb
exp40		7/4/2022 4:45 AM	Yes	NMR500	ghn_cacb
exp40		7/1/2022 7:43 PM	No	NMR500	ghn_cacb

Data Acquisition to First Storage

- Detect/determine configuration and settings
- Detect acquisition start/finish on spectrometer workstation
 - Or trigger a manual upload
- Copy all relevant data to the site gateway
 - TCP socket-based copy
 - If the gateway is unavailable, copy to a temporary location on the spectrometer workstation
- Gateway copies all relevant data to the repository receiver
 - Secure, reliable transmission
- Arrival of data triggers Parser operations
 - Moves data to Repository
 - Shared network storage device as Linux file system
 - Archiving and WORM takes place from here to Scalify array
 - Write metadata to postgresql tables
 - Write visibility statistics to Elasticsearch
- Experiment is now available for download, sharing, publishing, and visibility/operational concerns

Challenges and Lessons Learned

- What is a discrete work unit?
- Unique identifier
- Workflow considerations
- Robust transmission
- Technical Minutiae
- Agile transformation
- Visibility

Identify Discrete Units

- No intrinsic, system-assigned identifier from the software that produces the results
- Of Interest:
 - Individual units – single experiment – matched set of parameters and results
 - Combined units – matched parameters and results, but multiple different samples
 - E.g., metabolomics
 - Calibrating – shifting parameters, combined results
 - Transients – before and/or after the results of interest
 - User has wide latitude to design the acquisition process with pulse programs, making predicting the exact behavior somewhat challenging
- What are we identifying?
 - The acquisition – what if it's multi-part? Does a single acquisition make sense on its own in that case?
 - The upload attempt – what if it fails? Do we end up with multiple upload instances of the same acquisition?
 - What is the “real thing”? Are there different “real things” depending on the circumstances?

Workflow Considerations

Allow user-selected
opt-out

Allow
facility-manager-config
ured opt-out

Specify information that
cannot be harvested

- Mapping operating system
users to NAN users,
samples, projects, etc.

Which operating
system user process is
running the
experiment?

- Required to detect
experiment start/finish

Keeping multiple
settings separate and
organized (wrong
owner problem)

Thankfully only one
user can run the
spectrometer control
subsystem at a time,
which we can detect

Reliable Transmit/Receive

- Ensure every bit gets to the repository
 - Read it before it is overwritten
 - Handle partial results – identify broken parts
 - No bit flipping or network loss
- Secure transmission
 - No snooping
- Good citizen behavior
 - Don't attract/allow attacks, etc.
- What about extended downtime?
 - Detect issues that require manual intervention
- Retry until successful or called off
- Never INTERFERE WITH THE DEVICE, storage, the network, etc.
- Detect true duplicates in the landing zone/repository

Technical Minutiae

- Variations in workstation operating systems and supported standards (1990s to 2025)
- Receiver
- Gateway
- Workstation (NAN agent, everything else)
- Any of the networks involved
- Repository file systems
 - latency
 - read-only
- Databases
 - Maintenance windows
 - Failures
- Program bugs
 - Unexpected conditions
 - Things that break file systems, databases, network protocols
 - E.g., had to tell rsync not to pre-interpret the directory name because of embedded spaces and special characters
- Parsing challenges
 - Missing stuff
 - Extra stuff
 - Unexpected character sets (e.g., latin-1)
 - Non-standard XML, JSON implementations

Recovery Challenges

- Resolved infrastructure failure, followed by a surge of backlogged results – spike in demand
- User expectations around visibility
 - How long until something unexpected is dealt with?
- Use manual transmit for recovery
 - Legitimate provenance?
 - Do parts match (parameter files match results)?
 - Has anything (important) been modified?
- Anticipate conditions that might make data unrecoverable
 - Facility backups

Evolving Transformation

Being able to Re-Parse some or all
Experiments

**New points of emphasis
added**

New usage perspectives

A different way of using NMR that we
didn't anticipate

**Refined calculations and
formulas**

Correcting mistakes

**Newer workstation
software provides new or
better results and/or
metadata**

Visibility

- Instrument every operation/process
- Instrument your data
- Understand what you have
- Understand what you missed
- What is “useless”?
 - Parameters without results/results without parameters?
- Know if what you have can't provide what most people want
- But don't assume that everyone wants the same things
- Look for unexpected patterns

Current and Future Challenges

- Unexpected experiment volume
 - Attention (but not blind adherence) to rational limits of usefulness – throttling?
- Complex experiment groupings
 - What can we safely demote?
- Scaling up to more facilities
 - Well-positioned
- Expanding to multiple repositories
 - Data separation (e.g., Europe and North America)
 - Localized visibility
 - Consolidated visibility
- Continue to root out single points of failure
